**Mini Project Proposal**

**Project Title:**

Student Score Prediction using Machine Learning

---

**Problem Statement:**

Many students are unable to predict their exam performance based on their study habits. The aim of this project is to predict student marks based on study hours using a machine learning algorithm.

---

**Dataset:**

The dataset contains the following columns:

- Study Hours
- Marks

This dataset shows the relationship between the number of hours studied and the marks obtained by students.

---

**Algorithm Used:**

Linear Regression algorithm is used in this project.
This algorithm helps to find the relationship between study hours and marks and predicts the marks based on input study hours.

---

**Expected Output:**

The model will predict the marks scored by a student based on the number of study hours. The output will also include a graph showing the relationship between study hours and marks.
